

API Project Documentation

Project Name: Live Weather App

API Used: Open-Meteo API

- Geocoding endpoint:
<https://geocoding-api.open-meteo.com/v1/search>
 - Weather endpoint:
<https://api.open-meteo.com/v1/forecast>
-

How it works

1. User enters a city name.
 2. The app sends a request to the Geocoding API to get latitude and longitude.
 3. Using those coordinates, it sends a second request to the Weather API.
 4. The response is parsed using `.json()`.
 5. The temperature is displayed dynamically on the webpage.
-

Features

- Live weather data fetching using `fetch()`
 - Dynamic DOM updates
 - Loading and error states
 - Stores last searched city using `localStorage`
 - Personalized welcome message for returning users
-

Data Handling

- No user data is sent to external servers.
- Only the city name is stored locally in the browser.
- Data is used only to improve user experience.

Accessibility & Best Practices

- Uses clear text updates for screen readers
 - Includes loading and error feedback
 - Simple and responsive UI structure
-

Outcome

A fully functional web application that demonstrates real-time API integration, dynamic rendering, and basic personalization using frontend technologies.
